POST PRIMARY MATHS

# Geometry \& Trigonometry <br> Making connections across the syllabus 

Task 1.1 - Theorem 1 through the lens of Van Hiele

| Level | Name | Example for Theorem 1 |
| :---: | :---: | :---: |
| 0 | Visualisation |  |
| 1 | Analysis |  |
| 2 | Informal Deduction |  |
| 3 | Formal Deduction |  |
| 4 |  |  |

## Task 1.2 - Van Hiele

Table 1 The van Hiele model of geometric understanding describes a progression that is independent of age or grade level.

| Level | Name | Description | Example | Teacher Activity |
| :---: | :--- | :--- | :--- | :--- |
| 0 | Visualization | See geometric shapes <br> as a whole; do not <br> focus on their <br> particular attributes. | A student would identify a <br> square but would be unable to <br> articulate that it has four con- <br> gruent sides with right angles. | Reinforce this level by encouraging <br> students to group shapes according <br> to their similarities. |
| 1 | Analysis | Recognize that each <br> shape has different <br> properties; identify <br> the shape by that <br> property. | A student is able to identify <br> that a parallelogram has two <br> pairs of parallel sides, and that <br> if a quadrilateral has two pairs <br> of parallel sides it is identified <br> as a parallelogram. | Play the game "guess my rule," in <br> which shapes that "fit" the rule are <br> placed inside the circle and those <br> that do not are outside the circle (see <br> Russell and Economopoulos 2008). |
| 2 | Informal <br> deduction | See the <br> interrelationships <br> between figures. | Given the definition of a <br> rectangle as a quadrilateral <br> with right angles, a student <br> could identify a square as a <br> rectangle. | Create hierarchies (i.e., organiza- <br> tional charts of the relationships) <br> or Venn diagrams of quadrilaterals <br> to show how the attributes of one <br> shape imply or are related to the <br> attributes of others. |
| 3 | Formal <br> deduction | Construct proofs <br> rather than just <br> memorize them; see <br> the possibility of <br> developing a proof in <br> more than one way. | Given three properties about a <br> quadrilateral, a student could <br> logically deduce which state- <br> ment implies which about the <br> quadrilateral (see fig. 1). | Provide situations in which students <br> could use a variety of different angles <br> depending on what was given (e.g., <br> alternate interior or corresponding <br> angles being congruent, or same-side <br> interior angles being supplementary). |
| 4 | Rigor | Learn that geometry <br> needs to be under- <br> stood in the abstract; <br> see the "construction" <br> of geometric systems. | Students should understand <br> that other geometries exist and <br> that what is important is the <br> structure of axioms, postulates, <br> and theorems. | Study non-Euclidean geometries <br> such as Taxi Cab geometry <br> (Krause 1987). |

Fig. 1 Students should be able to answer this question using formal deduction.

Three Properties of a Quadrilateral
Property D: It has diagonals of equal length.
Property S: It is a square. Property R: It is a rectangle.

## Which is true?

a. D implies $S$, which implies $R$.
b. D implies R , which implies S .
c. S implies R, which implies D.
d. R implies $D$, which implies $S$.
e. R implies S, which implies D.

Task 2.1 - Good Practice in Geometry
Identifying Relationships in Geometry

PDSF

Task 3.1 - Going in Circles with Pythagoras

| Point | x-coordinate | y-coordinate | Distance from centre |
| :--- | :--- | :--- | :--- |
|  |  |  |  |
|  |  |  |  |
|  |  |  |  |
|  |  |  |  |
|  |  |  |  |

Task 3.2 - Still Going in Circles with Pythagoras

| x-coordinate | Horizontal <br> Distance | y-coordinate | Vertical <br> Distance | Distance <br> from Centre |
| :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |

## HW Task - Making Connections

Using the below theorem, can you identify some of the prior knowledge that would be required to fully understand this theorem, similar to task 2
